

## **Project Title**

An Automated System for Timely Ureteric Stent Removal (TRACER)

## **Project Lead and Members**

- Ye Shu Qin
- Prof. Lee Lui Shiong
- Lee Han Jie
- Khoo Pei Fong
- Lee Puay Chuan
- Moarie Grace Tan
- Tang Gui Feng
- Chia Sing Yi
- Wong Wan Chi
- Michelle Tan Siok Keow
- Kandy Yeo Jia Hui

## **Organisation(s) Involved**

Sengkang General Hospital

## **Healthcare Family Group(s) Involved in this Project**

Medical; Nursing; Allied Health

## **Applicable Specialty or Discipline**

Urology Department

## **Project Period**

Start date: May 2021

Completed date: December 2021

## **Aim(s)**

To develop an automated ureteric stent tracing system (TRACER) to ensure:

1. Comprehensive tracking of every stent inserted within patients.
2. Reliable uploading of tracing data to REDCAP for triggered reminders to clinicians.

## **Background**

See poster appended/ below

## **Methods**

See poster appended/ below

## **Results**

See poster appended/ below

## **Conclusion**

See poster appended/ below

## **Project Category**

Technology, Digitalization

Care & Process Redesign, Productivity: Manhour Saving; Time Saving

## **Keywords**

Automated Tracking System, Medical Implants

## **Name and Email of Project Contact Person(s)**

# An automated system to track and remind for timely ureteric stent removal (TRACER)

Sengkang General Hospital  
SingHealth

Lee Lui Shiong (DR), Lee Han Jie (DR) – Department of Urology

Ye Shuqin (NC), Khoo Pei Fong (ANC) – Operating Theatre

Lee Puay Chuan (Director)-Strategic Projects

Moarie Grace Tan (SNM), Tang Gui Feng (Exec) – CSSU, Chia Sing Yi (Database Coordinator) – Health Services Research Unit

Wong Wan Chi (Assistant Manager), Michelle Tan Siok Keow (Exec), Kandy Yeo Jia Hui (Exec) – Division of Surgery

## BACKGROUND

- Ureteric stents are commonly used in Urology; the department utilises around 300 – 500 stents a year.
- Stents however require timely removal to prevent complications of encrustation and obstruction. Such forgotten and encrusted stents require ureteroscopic intervention under general anaesthesia, which can be associated with ureteric injury and sepsis.
- The existing stent tracking system is based on manually filled forms managed by a single party, which are rigorously transferred to a REDCap stent registry for consolidation and triggered reminders.

## AIMS

- To develop an automated ureteric stent tracing system (**TRACER**) to ensure:
  - Comprehensive tracking of every stent inserted within patients.
  - Reliable uploading of tracing data to REDCAP for triggered reminders to clinicians.

## METHODOLOGY AND INTERVENTION

- The project team led the conceptualisation and implementation of the automated stent tracing system **TRACER**.
- TRACER uses a dual-prong system for stent tracking during each intra-operative insertion of ureteric stent:

- Input of stent used and side via **T-DOC instrument tracking system** by the **nursing team**:

Item	LOT	Last used	Expire date	Supplier/Manu	Remark
1	27335996	03/11/2021 11:5	17/05/2024	Boston Scientil	Left Side
2	27573060	16/11/2021 9:59	27/06/2024	Boston Scientil	
3	27056064	15/11/2021 10:4	28/03/2024	Boston Scientil	

**T-DOC instrument tracking system:** Lot number of the stent, date of use and laterality (left/right side) will be documented by nurses prior to use of each ureteric stent.

- Electronic medical records (EMR)** documented by the **surgical team**.

**Summary of Operation**  
Type of Operation: cystoscopy and insertion of left DJ stent  
Method of Operation: Medical  
Findings: Min. Invasive (MIS)  
stentL  
RPG: left small radioopaque stone at L4, left mild hydronephrosis  
bladder normal  
urethra slightly tight, but no stricture  
prostate not enlarged  
bilat UO normal

**Electronic Medical Records (EMR):** Maintained by surgeons – documentation of either “StentL”, “StentR”, or “Stent2” triggers registration on the TRACER system as a stent inserted on the left, right and both ureters respectively.

- By having **two independent parties** trigger the tracking system, the **number of potentially missed entries are minimised**.
- The system can be **easily configured** to include new clinicians joining the department, or remove clinicians no longer in the department.
- This data is then uploaded onto REDCAP, which automatically sends an email reminder to the physician if stent removal has not been performed before a defined time period.

- The email reminder is **repetitive**, until data entry for stent removal is completed by the clinician, to further ensure timely removal of stents.

Record ID	Survey Identifier	NREC	Visit ID	Patient Name	Date of Birth	Gender	Race	Data entered by	URO Consultant-in-charge	URO Consultant-in-charge email
1	temp				25-08-2018	Male (1)	Chinese (1)	dr14294h	Palaniappan Sundaram (1)	palaniappan.sundaram@singhealth.com

**REDCAP System:** Each stent inserted is linked to the primary clinician, and email reminders are triggered from this system, based on stent insertion date and date of expected stent removal.

Time sent: Scheduled to be sent at 22/11/2021 07:30

From: Sent automatically via Automated Invitations from [redacted]

To: [redacted]

Subject: [Reminder] Stent due for removal

Dear doctor-in-charge,

This is an automated reminder that your patient [redacted] had a stent insertion on 17-09-2021.

Please click on the link below to update the status.

You may open the survey in your web browser by clicking the link below:

[Removal Details \(Left\) - 6 weeks](#)

<https://seng.kh.com/redcap/surveys/2021-09-17-09-2021>

**Example of email reminder sent to clinicians:** Stent insertion date and patient's identifiers are sent to ensure timely removal of ureteric stents.

- The TRACER system was piloted in the Urology operating theatre between May and July 2021.

- The total number of stents tracked with TRACER were compared to the number of urologic procedures on eHINTS involving stent insertion.
- Manpower required and time spent implementing the TRACER system was compared to the existing system of manually uploading stent data

## RESULTS

From the positive results achieved during the pilot, the system is put in place permanently with below results tracked from May to Dec 2021.

### 1. ACCURATE TRACKING

- All 314 ureteric stents used accurately tracked** with complete linkage of data between eHINTS and TRACER. **21** stents not accounted for by clinician documentation detected by the algorithm, and surgeons were automatically informed to update the records.
- All stents removed on time**, except 2 patients who were transferred to another hospital for continuation of care.

### 2. MANPOWER SAVINGS

- Time spent for uploading stent data to REDCap per patient shortened from an average of **4 minutes** (when performed manually) to **30 seconds**, equal to an **87.5% savings** in man hours spent tracing stents.

## CONCLUSIONS

- TRACER is a novel automated system with the ability to accurately track and remind clinicians on the status of ureteric stents used during surgery.
- Use of TRACER is associated with significant time and manpower savings.
- Future plans:**
  - TRACER is **scalable to the tracking of all medical implants** besides stents, and its use will soon be implemented in the department of **interventional radiology**.
