CENTRE FOR HEALTHCARE INNOVATIONS

CHI Learning & Development (CHILD) System

Project Title

Nursing-led Protocol to Identify Semi Critical Results for Earlier Intervention and Reduce Risk of Critical Conditions

Project Lead and Members

• Sponsor & Facilitator: Dr Chionh Chang Yin

• Leader: SSN Yang Ko Chun

Co Leader: ANC Zhang Wei
 Changi General Hospital

Organisation(s) Involved

Changi General Hospital

Healthcare Family Group(s) Involved in this Project

Nursing, Medical

Applicable Specialty or Discipline

Renal Medicine

Aim(s)

- Shorten time from reporting of the semi critical results to a decision on action required
- Evaluate the frequency in which semi critical results require urgent actions
- Evaluate our current practices on identifying semi critical results

Background

See poster appended/ below

Methods

Nursing-led Protocol to Identify Semi-critical Results for Earlier Intervention and Reduce Risk of Critical Conditions

Sponsor & Facilitator: Dr Chionh Chang Yin

Leader: SSN Yang Ko Chun Co-Leader: ANC Zhang Wei

Changi General Hospital

Introduction

Renal medicine clinic provides care for those patients with various phases of kidney; disease and multiple comorbidities such as diabetes and ischemic heart disease. Patients with chronic kidney disease may suffer from acute derangements in laboratory indicators \ without any overt symptoms until late stages. Early detection of such derangements is vital; for initiating timely intervention.

 \sharp CGH has a hospital-wide protocol to ensure that critical results are communicated urgently \sharp in order to provide appropriate treatment. However, other abnormal results outside of the b $^{!}$ reference range are not flagged through the critical results notification system. However, $^{!}$ patients with non-critical abnormal results may still benefit from earlier intervention and $lac{1}{2}$ correction to reduce the chances of the condition becoming critical. We term these results t as "semi-critical results". We have found that most semi-critical results are related to labnormalities with haemoglobin, serum potassium and serum creatinine.

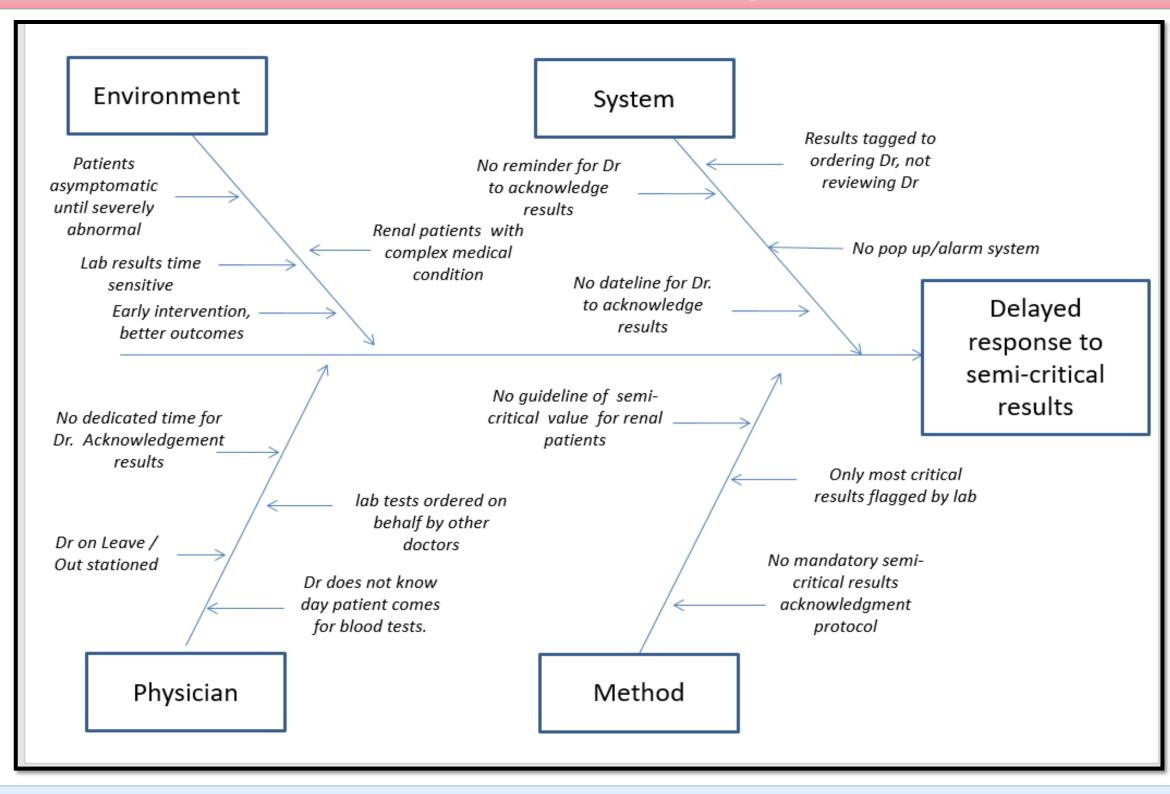

To avoid long waiting times, or to coincide with other appointments, patients are l frequently scheduled for tests at the Renal Medicine Clinic up to a month before the † appointment with the renal physician. The renal physician would not be aware if their † \dagger patients turn up for the tests. While there is a hospital electronic system for all doctors to \dagger acknowledge the results, it may take a few days to weeks for the results to be¦ † acknowledged. Often, the acknowledgement of results also takes place after office hours. † \sharp Laboratory tests are also often ordered by doctors from other disciplines (for example, \sharp after discharge from the wards) and the results acknowledgement system can only send; results to the ordering doctor.

¦Aims:

The objective of this project is to:

- 1. Shorten time from reporting of the semi-critical results to a decision on action required
- 12. Evaluate the frequency in which semi-critical results require urgent actions
- 3. Evaluate our current practices on identifying semi-critical results

Problem Analysis

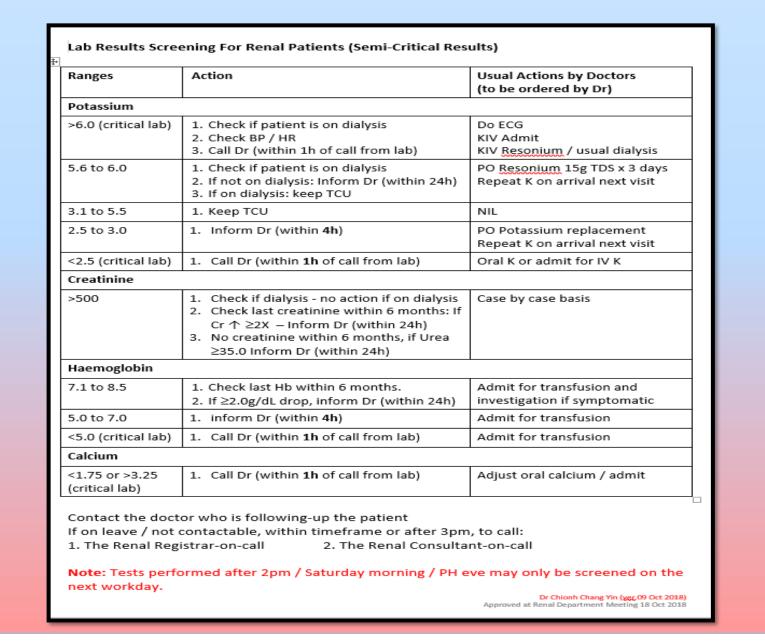

Methodology

Clinic nurse is aware when patient has been done laboratory tests. Therefore, to identify semi-critical results would be through the clinic nurse.

- 1. A Semi-critical screening guideline (Fig.A) was designed by renal consultant for nurses to use as a screening tool.
- * Eligible criterial: Patients who are doing laboratory test 1 week up to 1 month prior consultation.
- * Ineligible criterial: Patients who are doing laboratory test at the same date of consultation.
- * Tracing category: Haemoglobin, Serum Potassium and Serum Creatinine

Semi-critical screening guideline

Methodology (Con't)

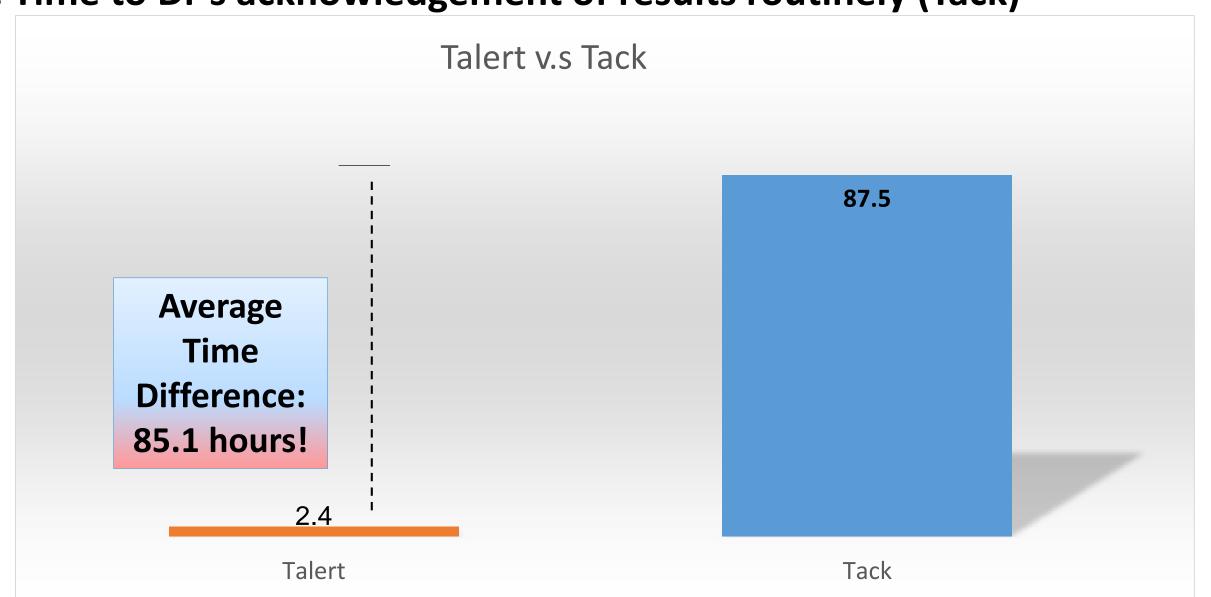

Renal Blood Investigations

- 2. Nurses will then trace the laboratory results via Citrix (Fig.B)
- 3. Semi-critical results will be highlighted to Dr. for earlier action **Common actions:**
 - 1) Send patient to A&E
 - 2) Stat admission

 - 3) Prescribe medication 4) Bring forward Dr's appointment
 - 5) Repeat Laboratory tests on the following appointment date
- 4. Documentation will be done by nurses once action is completed

Results

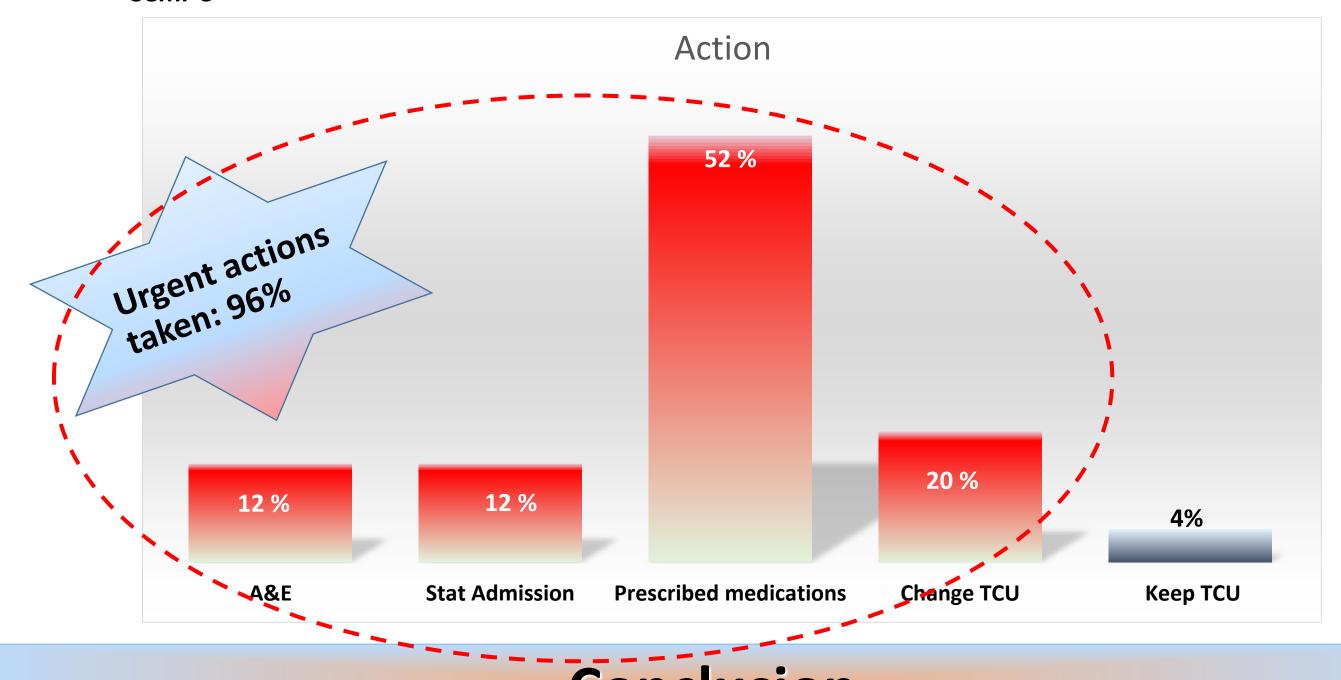

1. Average Time to Dr's action on semi-critical results with screening alert (Talert) v.s. Average Time to Dr's acknowledgement of results routinely (Tack)

2. Compared to the same patient ,Time to Dr's action on semi-critical results with screening alert (T_{alert}) v.s. Time to Dr's acknowledgement of results routinely

3. Evaluate the frequency in which semi-critical results require urgent actions: Actions Semi-C %

Conclusion

The implementation of Nursing-led protocol to trace semi-critical results and provide screening alerts has significantly shortened time from reporting to a decision on action. It enhanced patient's safety and reduced the chances of the condition becoming critical.

The challenge is that this requires more time and manpower for nurses to trace results, report to doctors and communicate with patients. Moving forward, it is proposed that our protocol can be integrated with laboratory systems to provide automatic alerts and direct to the correct doctor to acknowledge and act on the semi-critical results within predefined time.
